

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

1. (currently amended) Injection moulding device (1) comprising a mould body (2,5) having a cavity (4), an elongated nozzle (3) seated in the cavity, a valve pin (11) coaxially in the nozzle and actuating means (15) connected to the valve pin for axially displacing the valve pin in the nozzle, the actuating means comprising a cylinder housing (30) having a first and a second pressure medium inlet (38,39), and a piston (33) reciprocatable in the cylinder housing, the piston (33) being coupled to the valve pin (11), characterised in that the cylinder ~~[[ (15) ]]~~ housing is placed above the valve pin (11), coaxial therewith, the cylinder housing (30) being detachably coupled to a base member (14) on the mould body (2,5) and said cylinder housing defining a chamber with an upper part (31) having a first diameter, the piston (33) having a piston head (34) which is in contacting relationship with the walls of the upper chamber part (31), the first and second pressure medium inlets (38,39) connecting to the upper chamber part (31) above and below the piston head, respectively, and a lower chamber part (32) comprising a height adjustment means (40) that ~~[[ are ]]~~ is axially

displaceable in the cylinder housing (30), the height adjustment means (40) ~~comprising~~ having a bore ~~having~~ with a diameter, smaller than the diameter of the upper chamber part (31), the piston comprising a stem (35) being slidably seated in the bore of the height adjustment means (40), the valve pin (11) being guided through a bore (47) in the base member (14) and through the bore of the height adjustment means (40) and ~~being with~~ having a valve pin head (37) releasably attached to the piston (33).

2. (original) Injection moulding device (1) according to claim 1, wherein the piston stem (35) comprises an axial slot (36), extending to the perimeter of the stem, the slot (36) having a supporting shoulder engaging with a complementary shoulder on the valve pin head (37), the valve pin head being radially removable from the stem (35).

3. (currently amended) Injection moulding device (1) according to claim [[3]] 2, wherein the slot (36) has a generally T-shaped cross-section.

4. (previously presented) Injection moulding device (1) according to claim 2, wherein the valve pin head (37) comprises a flat section which is received in the slot (36) in a fixed angular position.

5. (previously presented) Injection moulding device (1) according to claim 1, wherein the height adjustment means (40) comprises a number of engagement elements (44) around its

perimeter, the cylinder housing (30) comprising an opening (43) connecting with the engagement elements (44).

6. (previously presented) Injection moulding device (1) according to claim 1, wherein the base member (14) comprises a cooling plate, having a cooling channel (18) located below the cylinder (15).

7. (currently amended) Injection moulding device (1) comprising a mould body (2,5) having a cavity, an elongated nozzle (3) seated in the cavity, a valve pin (11) extending coaxially in the nozzle and actuating means (15) connected to the valve pin for axially displacing the valve pin in the nozzle, the actuating means comprising a cylinder housing (30) having a first and a second pressure medium inlet (38,39) and a piston (33) reciprocable in the cylinder housing (30), the piston (33) being coupled to the valve pin (11), characterised in that the cylinder ~~[[15]]~~ housing is placed above the valve pin (11), coaxial therewith, the cylinder housing (33) being detachably coupled to a base member (14) on the mould body (2,5), and said cylinder housing defining a chamber with an upper part (31) having a first diameter, the piston having a piston head (34) which is in contacting relationship with the walls of the upper chamber part (31), the first and second pressure medium inlets (38,39) connecting to the upper chamber part (31) above and below the piston head (34), respectively, and a lower chamber part (32)

comprising a height adjustment means that ~~[[are]]~~ is axially displaceable in the cylinder housing (30), the height adjustment means (40) ~~comprising~~ having a bore ~~having~~ with a diameter smaller than the diameter of the upper chamber part (31), the piston comprising a stem (35) slidably seated in the bore of the height adjustment means (40) along flexible seals (42) at the perimeter of the bore, the valve pin (11) being guided through a bore (17) in the base member (14) and through the bore of the height adjustment means (40), the base member comprising a cooling channel (18) located below the cylinder (15).

8. (currently amended) Cylinder assembly (14,15) comprising a cylinder housing (30) having a first and second pressure medium inlet (38,39), and a piston (33) reciprocatable in the cylinder housing (30), the piston (33) being coupled to the valve pin (11), characterised in that the cylinder housing (30) is detachably coupled to a base member (14) and defining a chamber with an upper part (31) having a first diameter, the piston (33) having a piston head (34) which is in contacting relationship with the walls of the upper chamber part (31), the first and second pressure medium inlets (38,39) connecting to the upper chamber part above and below the piston head (34), respectively, and a lower chamber part (32) comprising a height adjustment means (40) that ~~[[are]]~~ is axially displaceable in the cylinder housing, the height adjustment means ~~comprising~~ having a

bore ~~having~~ with a second diameter[[,]] smaller than the diameter of the upper chamber part (31), the piston comprising a stem (35) being slidably seated in the bore of the height adjustment means (40) along flexible seals (42) at the perimeter of the bore, the valve pin (11) being guided through a bore (17) in the base member and through the bore of the height adjustment means (40), the base member comprising a cooling channel (18) located below the cylinder (15).

9. (previously presented) Injection moulding device (1) according to claim 3, wherein the valve pin head (37) comprises a flat section which is received in the slot (36) in a fixed angular position.
